

FCI Nunchaku®

FCI EXCLUSIVE

Description :

FCI NUNCHAKU® is a pushed silicone self-retaining bicanalicular nasolacrimal intubation stent that acts like a conformer, allowing tears to drain by capillarity. The metallic guides are located inside the lumen, not as an extension of the stent as in conventional intubation sets. Therefore, no nasal retrieval is needed.

Main characteristics :

- Indicated for canalicular pathologies, congenital lacrimal duct obstruction, and dacryocystorhinostomy (DCR)
- Stability is achieved by the larger diameter stent segments in the sac at the junction of the common canaliculus
- 0.60 mm silicone tube for a comfortable fit in the interpalpebral loop
- No nasal retrieval
- No knot or suture needed
- 2 sizes; 90 mm for children, 105 mm for adults
- Medical grade silicone
- Sterile

AVAILABLE IN CANADA
